

01 · COMPANY OVERVIEW

Executive summary

The deterministic control plane for enterprise agents. Governed execution, trustworthy results.

Agent Logic is building the infrastructure required for the next generation of enterprise AI. While today's AI systems excel at answering questions, enterprises increasingly need AI that performs complex work reliably, transparently, and under organizational governance. Existing agents are largely stateless, difficult to audit, and challenging to deploy where trust, repeatability, and operational control matter.

Agent Logic addresses this gap through the Agent Design Language (ADL), a platform for building persistent, inspectable, and governed AI agents: structured multi-agent orchestration, deterministic execution, replayable workflows, persistent observational memory, and enterprise-ready governance. Rather than treating AI as isolated conversations, ADL enables durable AI systems that execute meaningful work while remaining reviewable and accountable.

Our first commercial product, CodeFriend, brings these capabilities to software engineering: agent teams deliver code through the Cognitive SDLC, with every change bound to an issue, validated, and reviewed from four independent perspectives. CodeFriend serves as the first production implementation of the ADL platform.

02 · THE PLATFORM

- 01 ADL — the language.** Agents, tools, permissions, workflows, and validation rules in one specification a human can read and a runtime can enforce.
- 02 ADL Runtime — the control plane.** Policy enforced, tool use gated, every prompt and state transition recorded as a replayable record.
- 03 CodeFriend — the proving ground.** AI-native software engineering through the Cognitive SDLC. In development; early access via design partners.

03 · THE OPPORTUNITY

The next decade of enterprise AI will require a common execution substrate analogous to an operating system: infrastructure for trustworthy coordination, persistence, governance, and collaboration across many specialized agents. Agent Logic is building that foundation. We are raising a \$3M seed on a standard post-money SAFE with a \$20M valuation cap, funding 18 months from working platform to CodeFriend GA, five design partners, and first ARR under contract.
